## Oxford Revise | AQA GCSE Maths Higher | Answers

Chapter 18 Polygons, angles, and parallel lines

| Question | Answer | Extra information | Marks |
| :---: | :---: | :---: | :---: |
| 18.1 | Angle $A F G=75^{\circ}$ (opposite angles) <br> Angle AGF $=80^{\circ}$ (adjacent angles in a parallelogram) <br> Angle GAF $(x)=180-75-80=25^{\circ}$ |  | $\begin{array}{\|l\|} \hline 1 \\ 1 \\ 1 \\ \hline \end{array}$ |
| 18.2 (a) | $x=3$ |  | 1 |
| 18.2 (b) | $1+3+1+3=8 \text { parts }$ <br> The angles in a parallelogram add up to $360^{\circ}$. $\begin{aligned} & 360^{\circ} \div 8=45^{\circ} \\ & 3 \times 45^{\circ}=135^{\circ} \end{aligned}$ <br> Two of the angles are $45^{\circ}$ and two of the angles are $135^{\circ}$ | $360 \div 8(=45)$ <br> Fully correct answer | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |
| 18.3 | Angle $x=136^{\circ}-4 c$ <br> (Corresponding angles are equal.) $3 c+63^{\circ}+136^{\circ}-4 c=180^{\circ}$ <br> (Angles on a straight line sum to $180^{\circ}$ ) $\begin{aligned} & 199^{\circ}-c=180^{\circ} \Rightarrow c=19^{\circ} \\ & y=136^{\circ}-4 \times 19^{\circ}=60^{\circ} \end{aligned}$ <br> (Alternate angles are equal.) $d=180^{\circ}-90^{\circ}-60^{\circ}=30^{\circ}$ <br> (Angles on a straight line sum to $180^{\circ}$ ) | $3 c+63+136-4 c=180$ <br> Solving equation $d=30$ <br> Geometric reasons given. | $\begin{aligned} & 1 \\ & 1 \\ & 1 \\ & 1 \end{aligned}$ |

| Question | Answer | Extra information | Marks |
| :---: | :---: | :---: | :---: |
| 18.4 | $151^{\circ}-3 x+x+y+51^{\circ}=180^{\circ}$ <br> (Angles on a straight line sum to $180^{\circ}$ ) $x+53^{\circ}+2 y+36^{\circ}=180^{\circ}$ <br> (Angles on a straight line sum to $180^{\circ}$ ) <br> Simplifying both equations, $\begin{aligned} & 22=2 x-y(1), 91=x+2 y(2) \\ & 2 \times(1)+(2): 135=5 x ; x=27^{\circ} \end{aligned}$ <br> Substituting into (2), $91=27+2 y$; $2 y=64 ; y=32^{\circ}$ <br> Substituting these values into each slice size, the angles are $70^{\circ}, 110^{\circ}$, $100^{\circ}$ and $80^{\circ}$. The largest slice size is $110^{\circ}$ | $151-3 x+x+y+51=180$ or $x+53$ $+2 y+36=180$ with reason (angles on a straight line sum to $180^{\circ}$ ) <br> Attempt to solve Correct answer for both $x$ and $y$ $110^{\circ}$ as final answer. | $\begin{aligned} & 1 \\ & 1 \\ & 1 \end{aligned}$ |
| 18.5 | Angles on a straight line add up to $180^{\circ}$. <br> Angle $A B C=180^{\circ}-95^{\circ}=85^{\circ}$ <br> Opposite angles of a rhombus are equal. <br> Therefore, $x=85^{\circ}$ | Each correct reason stated Correct answer of $85^{\circ}$ | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |
| 18.6 | Angle $E A D=44^{\circ}$ (alternate angles) <br> Angle $F D E=180^{\circ}-90^{\circ}-44^{\circ}=46^{\circ}$ <br> (Angles in triangle add up to $180^{\circ}$ ) | Angle $E A D=44$ 180-90-angle EAD Correct final answer. | $\begin{aligned} & 1 \\ & 1 \\ & 1 \\ & \hline \end{aligned}$ |
| 18.7 | Angle $S T U=$ angle $P Q R=60^{\circ}$ (equilateral triangles) $t=\frac{360-(60+60)}{2}=120^{\circ}$ <br> (Opposite angles of a parallelogram are equal and angles in a quadrilateral sum to $360^{\circ}$.) | 2 marks for $t=120$ or 1 mark for either STU <br> or $P Q R=60$; <br> 1 mark for any correct geometrical reason; 1 mark for fully correct geometrical reasons. | 3 |

| Question | Answer | Extra information | Marks |
| :---: | :---: | :---: | :---: |
| 18.8 | $\begin{aligned} & x+y=2 x-y+99^{\circ} \text { (from kite symmetry) } \\ & x+y+2 x-y+99^{\circ}+y+25+x-25=360^{\circ} \end{aligned}$ <br> (Angles in a quadrilateral add up to $360^{\circ}$.) <br> Simplifying both equations, $\begin{aligned} & -x+2 y=99(1), 4 x+y=261(2) \\ & 4 \times(1)+(2): 9 y=657 ; y=73^{\circ} \end{aligned}$ <br> Substituting into (2), $4 x+73=261 ; 4 x=188$; $x=47^{\circ}$ | $\begin{aligned} & x+y=2 x-y+99 \\ & \text { or } x+y+2 x-y+99+y+25+x- \\ & 25=360 \end{aligned}$ <br> Attempt to eliminate either $x$ or $y$ and solve Correct answer for $x$ or $y$ Correct answer for both $x$ and $y$. | 1 <br> 1 <br> 1 1 |
| 18.9 | $360^{\circ} \div 60^{\circ}=6$ <br> The shape is a (regular) hexagon. | $360 \div 60=6$ or for stating that exterior angles add to $360^{\circ}$ Hexagon | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |
| 18.10 | $\begin{aligned} & (n-2) \times 180^{\circ}=1620^{\circ} \\ & n=1620 \div 180+2=11 \\ & \text { The polygon has } 11 \text { sides. } \end{aligned}$ | $\begin{aligned} & (n-2) \times 180=1620 \\ & 11 \end{aligned}$ | $\begin{aligned} & 1 \\ & 1 \end{aligned}$ |
| 18.11 | $\begin{aligned} & (8-2) \times 180^{\circ}=1080^{\circ} \\ & 1080^{\circ} \div 8=135^{\circ}(=\text { angle in octagon }) \\ & x=360^{\circ}-60^{\circ} \text { (equilateral triangle) }-90^{\circ} \text { (square) }-135^{\circ} \text { (octagon) }= \\ & 75^{\circ} \\ & \text { (Angles around a point add up to } 360^{\circ} \text { ) } \end{aligned}$ | Method to find interior angle of octagon $135$ <br> Subtracting your 3 angles from 360 Correct final answer of $75^{\circ}$. If no marks scored, score 1 mark for 60 (equilateral triangle) or 90 (square). | $\begin{aligned} & \hline 1 \\ & 1 \\ & 1 \\ & 1 \\ & 1 \end{aligned}$ |
| 18.12 | Exterior angle $=180^{\circ}-80^{\circ}=100^{\circ}$ $360^{\circ} \div 100^{\circ}=3.6$ <br> A polygon cannot have 3.6 sides, so Sophia is correct. | $\begin{aligned} & 180-80\left(=100^{\circ}\right) \\ & 360 \div 100\left(=3.6^{\circ}\right) \end{aligned}$ <br> Concluding that Sophia is correct with full explanation. | $\begin{aligned} & 1 \\ & 1 \\ & 1 \end{aligned}$ |

| Question | Answer | Extra information | Marks |
| :---: | :---: | :---: | :---: |
| 18.13 | Angle $B F E=50^{\circ}$ (Alternate angles are equal) <br> Angle $F H E=100^{\circ}$ (Angles in a triangle sum to $180^{\circ}$ ) <br> Angle $F H I=80^{\circ}$ (Angles on a straight line sum to $180^{\circ}$ ) <br> $x=90^{\circ}$ (Angles in a triangle sum to $180^{\circ}$ ) | 1 correct angle with a correct reason <br> 2 correct angles with correct reasons <br> Fully correct answer | $\begin{aligned} & 1 \\ & 1 \\ & 1 \end{aligned}$ |
| 18.14 | ```Sum of interior angles \(=(6-2) \times 180=720^{\circ}\) Let angle FED \(=x\) Then angle \(B C D=2 x\) \(141+127+90+134+2 x+x=720^{\circ}\) \(3 x=228^{\circ}\) \(x=76^{\circ}\) Angle \(F E D=76^{\circ}\)``` | Method for sum of interior angles ( $=720^{\circ}$ ) <br> Use of $B C D=F E D$ (e.g. algebraically) <br> Correct equation <br> Correct method of solution <br> Correct answer | $\begin{array}{\|l} 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{array}$ |
| 18.15 | $\begin{aligned} & \text { Sum of interior angles }=(5-2) \times 180\left(=540^{\circ}\right) \\ & \text { Angle } A B C=1.5 \times 82\left(=123^{\circ}\right) \\ & \text { So angle } A E D=123^{\circ}(\text { by symmetry }) \\ & \text { Let angle } B C D=x \\ & \text { Then angle } C D E=x(\text { by symmetry }) \\ & 82+123+123+x+x=540^{\circ} \\ & 2 x=212^{\circ} \\ & x=106^{\circ} \\ & \text { Angle } B C D=106^{\circ} \\ & \hline \end{aligned}$ | Method for sum of interior angles $\left(=540^{\circ}\right)$ <br> $1.5 \times 82\left(=123^{\circ}\right)$ <br> Symmetry used at least once (e.g. $\left.A E D=123^{\circ}\right)$ <br> Correct equation <br> Correct method of solution <br> Correct answer | 1 1 <br> 1 1 1 |

| Question | Answer | Extra information | Marks |
| :--- | :--- | :--- | :--- |
| 18.16 | $4^{2} \times 8^{2}=\frac{1}{2^{x}}$ | Convert 4 and 8 to powers of 2 <br> Use rules of exponents to express <br> each as the number 2 raised to a <br> single power | 1 |
|  | 1 |  |  |
|  | Write $\frac{1}{2^{x}}$ as $2^{-x}$ <br> $2^{10}=2^{-x}$ <br> $x=-10$ | Equate the powers to get the final <br> answer | 1 |

| Question | Answer | Extra information | Marks |
| :---: | :---: | :---: | :---: |
| 18.17 | $\begin{aligned} & y \propto \sqrt{2 x} \\ & y=\frac{k}{\sqrt{2 x}} \\ & \frac{1}{4}=\frac{k}{\sqrt{64}} \\ & \frac{1}{4}=\frac{k}{8} \\ & k=2 \\ & 3 \sqrt{2}=\frac{2}{\sqrt{2 x}} \\ & 3 \sqrt{2} \times \sqrt{2 x}=2 \\ & 3 \sqrt{2} \times \sqrt{2} \times \sqrt{x}=2 \\ & 3 \times 2 \times \sqrt{x}=2 \\ & \sqrt{x}=\frac{1}{3} \\ & x=\frac{1}{9} \end{aligned}$ | Write the relationship using a constant of proportionality Solve for the constant of proportionality <br> Use this with the value $y=3 \sqrt{2}$ Obtaining $\sqrt{x}=\frac{1}{3}$ <br> Fully correct answer | $\begin{aligned} & 1 \\ & 1 \\ & 1 \\ & 1 \\ & 1 \\ & 1 \end{aligned}$ |
